Contents

1	Table of Contents	3
1.1	LAPM.phase_type	3
1.2	LAPM.linear_autonomous_pool_model	4
1.3	LAPM.dtmc	4
1.4	LAPM.example_models	4
1.5	LAPM.emmanuel	5
2	Important Note	7
3	Indices and tables	9
	Python Module Index	11

LAPM is a simple Python package to deal with linear autonomous pool models of the form

$$\frac{d}{dt} x(t) = B x(t) + u.$$

It provides symbolic and numerical computation of

- steady state content
- steady state release
- transit time, system age, pool age
 - density
 - (cumulative distribution function)
 - mean
 - standard deviation
 - variance
 - higher order moments
 - (Laplace transforms)

CHAPTER 1

Table of Contents

<i>phase_type</i>	Module for phase-type distribution.
<i>linear_autonomous_pool_model</i>	Module for linear autonomous pool models.
<i>dtmc</i>	Module for discrete-time Markov chains (DTMCs).
<i>example_models</i>	Example linear autonomous pool models.
<i>emanuel</i>	Example: Emanuel's model

1.1 LAPM.*phase_type*

Module for phase-type distribution.

T is supposed to be a phase-type distributed random variable.

Functions

<i>cum_dist_func(beta, B, Qt)</i>	Return the (symbolic) cumulative distribution function of phase-type.
<i>density(beta, B, Qt)</i>	Return the (symbolic) probability density function of the phase-type distribution.
<i>expected_value(beta, B)</i>	Return the (symbolic) expected value of the phase-type distribution.
<i>laplace(beta, B)</i>	Return the symbolic Laplacian of the phase-type distribution.
<i>nth_moment(beta, B, n)</i>	Return the (symbolic) n th moment of the phase-type distribution.
<i>standard_deviation(beta, B)</i>	Return the (symbolic) standard deviation of the phase-type distribution.
<i>variance(beta, B)</i>	Return the (symbolic) variance of the phase-type distribution.

Continued on next page

Table 2 – continued from previous page

<code>z(B)</code>	Return the (symbolic) vector of rates toward absorbing state.
-------------------	---

1.2 LAPM.linear_autonomous_pool_model

Module for linear autonomous pool models.

Classes

<code>LinearAutonomousPoolModel(u, B[, ...])</code>	General class of linear autonomous compartment models.
---	--

Exceptions

<code>Error</code>	Generic error occurring in this module.
<code>NonInvertibleCompartmentalMatrix</code>	

1.3 LAPM.dtmc

Module for discrete-time Markov chains (DTMCs).

Classes

<code>DTMC(beta, P)</code>	Class of discrete time Markov chains.
----------------------------	---------------------------------------

Exceptions

<code>Error</code>	Generic error occurring in this module.
--------------------	---

1.4 LAPM.example_models

Example linear autonomous pool models.

Classes

<code>TwoPoolsFeedback(alpha_12, alpha_21, u_1, u_2)</code>	Two-compartment model with feedback.
<code>TwoPoolsFeedbackSimple(alpha, u_1)</code>	Two-compartment model with no feedback.
<code>TwoPoolsNoFeedback(alpha, u_1, u_2)</code>	Two-compartment model with no feedback.

1.5 LAPM.emmanuel

Example: Emanuel's model

Functions

<code>emanuel()</code>	Initialize Emanuel's model, show the functionality.
<code>plot_emmanuel_ages(EM)</code>	Plot system content versus system age.

CHAPTER 2

Important Note

$\mathbf{B} = (\mathbf{b}_{ij})$ has always to be an invertible *compartmental matrix*:

- $b_{ii} < 0$ for all i
 - $b_{ij} \geq 0$ for $i \neq j$
 - $\sum_{i=1}^d b_{ij} \leq 0$ for all j
-

CHAPTER 3
